

In-Class Assignment 1

Your first assignment is to make a simple web page that does the following:

- Changes the background color.
- Changes the text color.
- Changes the color hyperlinks.
- Has at least one block of text with a background color that is different from the rest of the page. (Use a div or span tag to do this).

In addition, the style html attribute is not allowed. You must do this with your css file. You will only need to select tags by name, as we did in the examples on the lecture slides.

You will need only two css attributes to do this.

color: changes text color.

background: changes the background color.

Example:

```
form
{
    background: red;
    color: yellow;
}
```

You can find a link to a list of color names that can be used with these attributes on the course Web page.
